Dear Sir,

SIGNIFICANT HIGH GRADE HEMATITE ZONES OUTLINED AT DALTONS JOINT VENTURE IRON ORE PROJECT - E45/2186, E45/2187, E45/2921, E45/2922

- Helicopter supported rock sampling and mapping has outlined substantial zones of high grade hematite iron ore outcrop at Haoma's 25% owned Daltons JV tenements in the Pilbara region of Western Australia.

The Directors of Haoma Mining NL ("Haoma") are pleased to report that helicopter supported rock sampling and mapping has outlined several substantial zones of outcropping high grade hematite iron ore at the Daltons Joint Venture tenements (Giralia Resources NL 75%, Haoma 25%).

Daltons Iron Ore Joint Venture (Giralia Resources NL 75%, Haoma Mining NL 25%)

Haoma holds a 25% interest with Giralia Resources NL (75% interest) in the Daltons Iron Ore Joint Venture, located 150 kilometres south of Port Hedland in the Pilbara region of Western Australia. Haoma retains rights to 100% of the gold/silver and tin/tantalum mineralisation in the tenements.

The Daltons JV tenements lie only 20 to 30 kilometres east of BHP Billiton and FMG rail lines. Competitor activity for iron ore in the area is intense, with Atlas Iron Limited completing a Pre Feasibility Study on its Abydos deposit around 25 kilometres to the north of the Daltons JV area, and FMG reporting strongly magnetic banded iron formation (“BIF”) up to 400 metres thick from the nearby FMG/Baosteel Glacier Valley magnetite joint venture.

The Daltons JV tenements host around 30 strike kilometres of Archaean age BIF mapped by the GSWA as extensions to the units that host iron ore deposits and prospects to the north.

Using helicopter support, a total of 70 rock chip samples were collected from outcrops of BIF in the Daltons JV area, with 26 samples returning potentially direct shipping (“DSO”) grades of iron ore. Most significant is a substantial 600 metres by 450 metres zone of strong hematite enrichment in the east of the JV area where average iron grades exceed 63% Fe. The mineralisation is interpreted to occur in a fold hinge and appears relatively shallowly dipping locally. The overall thickness of the mineralisation can only be determined by drilling. Additionally rock chip sampling of an area just to the north of the new discovery has returned a grade of 62.2% Fe from another outcrop of massive hematite extending for approximately 200 metres by 200 metres. This area is a direct extension of Atlas Iron’s Mt Webber prospect, where a rock chip traverse sample of 302 metres @ 59% Fe is reported by Atlas from immediately across the tenement boundary.

Further mapping and sampling of a prominent BIF/chert range in the west of the Daltons JV area outlined potential for magnetite type iron ore mineralisation, with thick zones of BIF grading 30 to 47% Fe identified in preliminary reconnaissance.

All coordinates in Zone 50 GDA 94, by hand held GPS ($\pm 10m$). XRF analyses by Spectrolab Laboratory Geraldton. QA/QC included field duplicate samples and standards (Certified Reference Material).

The information in this report that relates to Exploration Results is based on information compiled by R M Joyce, who is a Member of the Australasian Institute of Mining and Metallurgy. Mr Joyce has sufficient experience which is relevant to the style of mineralisation and type of deposit under consideration and to the activity which he is undertaking to qualify as a Competent Person as defined in the 2004 Edition of the 'Australasian Code for Reporting of Exploration Results, Mineral Resources and Ore Reserves'. Mr Joyce consents to the inclusion in the report of the matters based on the information in the form and context in which it appears.
